

## 2.Navigating to URL

### Step 2 : Navigating to URL

After launching the browser the next step is to navigate to our application under test's URL, which is done using get function.

#### Get Command:

For example to launch google.com page :

```
WebDriver driver = new FireFoxDriver()  
driver.get("http://www.google.com");
```

#### Refresh the webpage

```
driver.navigate().refresh();
```

The navigation class can be used to navigate backward and forward in a browser as follows :

```
driver.navigate().back();  
driver.navigate().forward();
```

Also navigation class can be used as a substitute for get command, as follows :

```
driver.navigate().to("http://www.google.com");
```

#### Maximizing the Browser window

```
driver.manage().window().maximize();
```

Using the window class we can set the size and position of browser window to a particular size and to a specific position, as follows :

```
driver.manage().window().setSize(new Dimension(1024, 768));  
driver.manage().window().setPosition(new Point(20, 30));
```
